Biology 350: Animal Physiology Spring 2021

This one is short and opens the mind to animal behaviors – what is the physiology behind on of these ?

https://www.youtube.com/watch?v=N0h7ycVCMqI

Instinct behaviors – kind of neat- not too longwe can talk about some content

https://www.youtube.com/watch?v=zb1YFpmuIXA

On your own if you are bored and like watching animals in the wild

https://www.youtube.com/watch?v=rkqKoyGhZL4

Saundra Yancy McGuire, Ph.D. Retired Asst. Vice Chancellor & Professor of Chemistry Director Emerita, Center for Academic Success Louisiana State University

Metacognition

The ability to:

- think about one's own thinking
- be consciously aware of oneself as a problem solver
- monitor, plan, and control one's mental processing (e.g. "Am I understanding this material, or just memorizing it?")
- accurately judge one's level of learning

Flavell, J. H. (1976). Metacognitive aspects of problem solving. In L. B. Resnick (Ed.), The nature of intelligence (pp.231-236). Hillsdale, NJ: Erlbaum

Reflection Questions

 What's the difference, if any, between studying and learning?

- For which task would you work harder?
 - A. Make an A on the test
 - B. Teach the material to the class

Counting Vowels in 45 seconds

How accurate are you?

Count all the vowels in the words on the next slide.

Dollar Bill Dice Tricycle Four-leaf Clover Hand Six-Pack Seven-Up Octopus

Cat Lives **Bowling Pins Football Team** Dozen Eggs **Unlucky Friday** Valentine's Day Quarter Hour

How many words or phrases do you remember?

Let's look at the words again...

What are they arranged according to?

Dollar Bill Dice Tricycle Four-leaf Clover Hand Six-Pack Seven-Up Octopus

Cat Lives **Bowling Pins** Football Team Dozen Eggs **Unlucky Friday** Valentine's Day Quarter Hour

NOW, how many words or phrases do you remember?

What were two major *differences* between the two attempts?

1. We knew what the task was

2. We knew how the information was organized

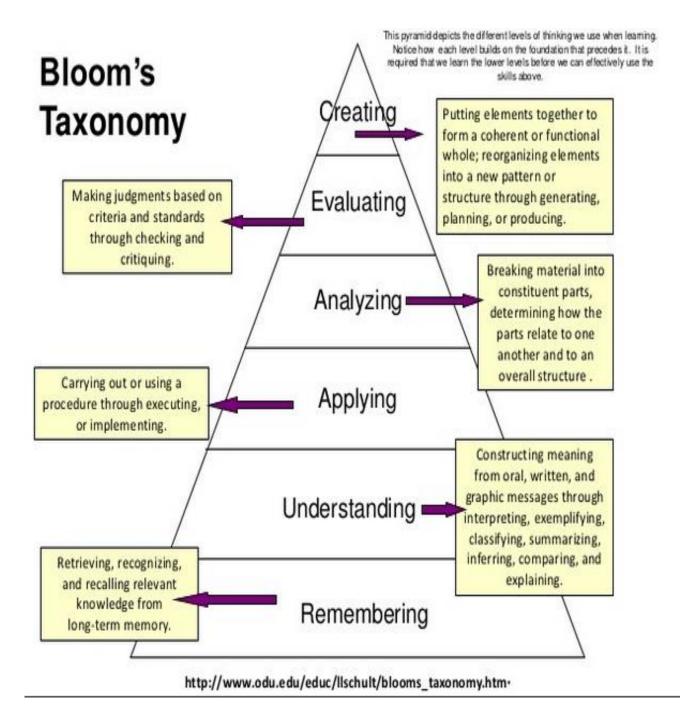

What we know about learning

- Active learning is more lasting than passive learning -- Passive learning is an oxymoron*
- Thinking about thinking is important – Metacognition**
- The level at which learning occurs is important
 - Bloom's Taxonomy***

*Cross, Patricia, "Opening Windows on Learning" League for Innovation in the Community College, June 1998, p. 21.

** Flavell, John, "Metacognition and cognitive monitoring: A new area of cognitivedevelopmental inquiry." American Psychologist, Vol 34(10), Oct 1979, 906-911.

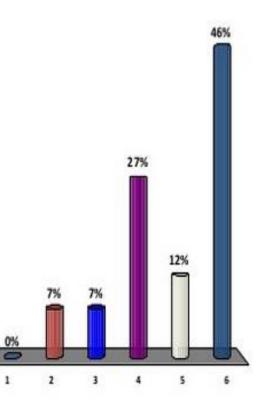

*** Bloom Benjamin. S. (1956). Taxonomy of Educational Objectives, Handbook I: The Cognitive Domain. New York: David McKay Co Inc.

How students answered (in 2014)

At what level of Bloom's do you think you'll need to operate to make A's in college?

- 1. Remembering
- 2. Understanding
- 3. Applying
- 4. Analyzing
- 5. Evaluating
- 6. Creating

The Study Cycle

OK so now how are you going to study for your classes ?

Do you really want to learn content?

http://www.ukclimbi ng.com/news/item. php?id=49981

If you get a chance, watch this youtube movie. Think about the physiology going on. Psychological factors.... Controlled by physiology. Muscle, sensory, thought, experience, fatigue, what else Breathing ?

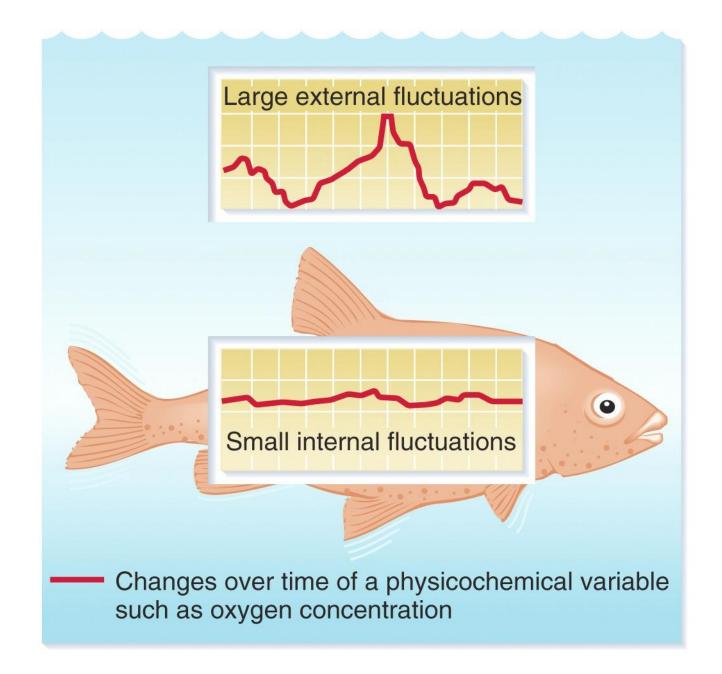

Physiology

- Define: The study of how living organisms function
- Structure & function are important to understand function
- Why study: Curiosity. Better understand how humans function under normal conditions. Thus, modifications of pathological states back to a 'normal' state might be possible.

- Many of the physiological process are described by chemical and physical properties
- It is important to integrate these concepts with biology.

- The physiology of an animal is well suited to the environment in which it has evolved.
 This is explained by the process of ADAPTATION- gradual change over many generations. Evolutionary process.
- Acclimatization is a change of an individual over its lifetime of biochemical or anatomical alterations.
- Acclimation is like acclimatization but induced by experimentation.

- Homeostasis The tendency of an organism to regulate and maintain relative internal stability.
- Cannon coined this term 1929
- See history section: <u>https://en.wikipedia.org/wiki/Homeostasis</u>

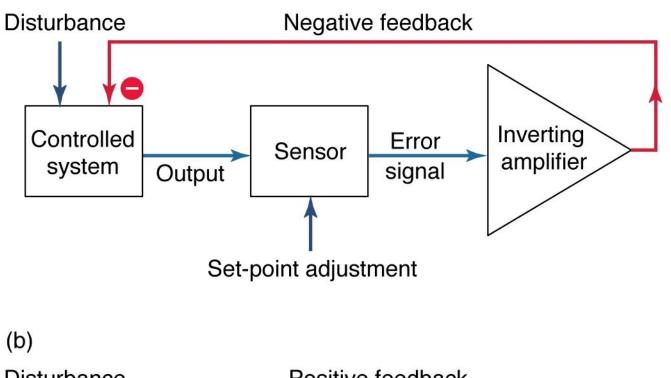

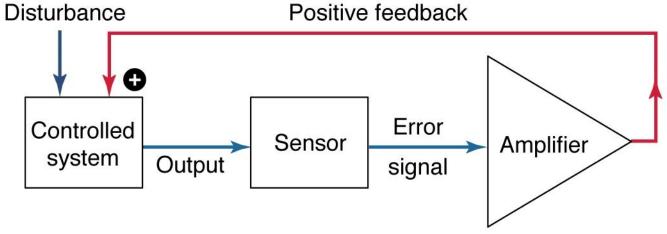

This mostly works by a feed back control.

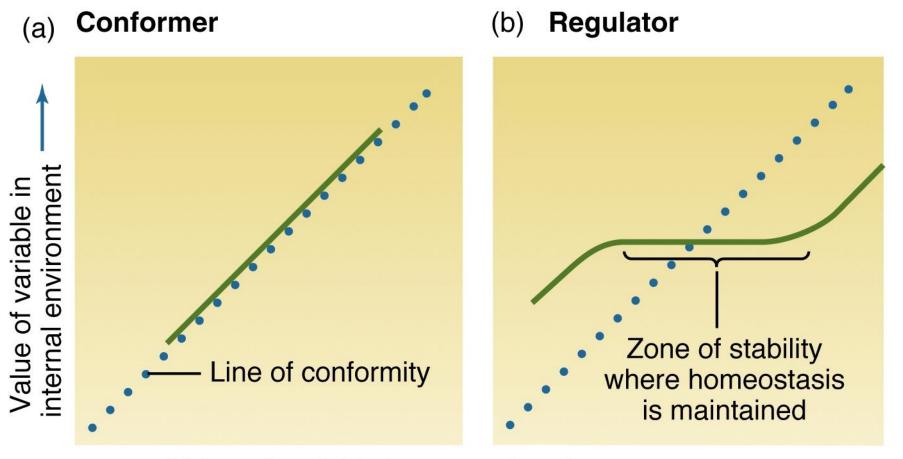

Such as by a negative feedback.

Examples - Temp, pH, salinity within the body

(a)

- Know August Krogh principle.
- that there is an animal optimally suited to yield an answer of a physiological problem to be addressed.

- Can you think of some examples ? (Put in your ppt notes)

Question: Does a chicken egg *lose* weight in development to a chick about to hatch ?

- a. It gains weight
- b. It loses weight
- c. It stays the same weight

Write out your logic

Cell level – it all starts here

Categories of organic molecules

Carbohydrates

- Monosaccharides (e.g. glucose)
- Polysaccharides (e.g. glycogen, cellulose, chitin)
- Lipids
 - Fatty acids
 - Triglycerides
 - Phospholipids
 - Cholesterol

Categories of organic molecules

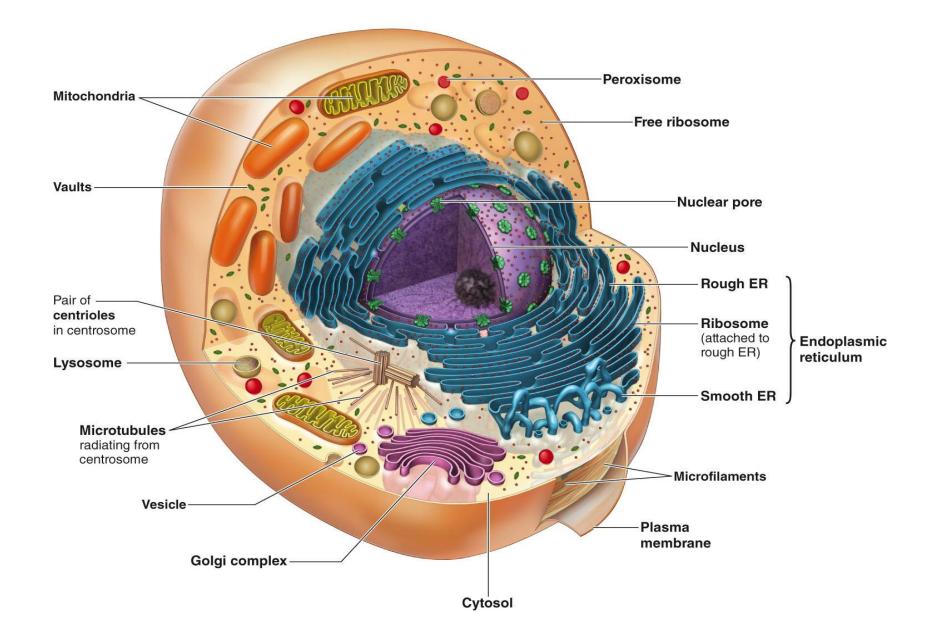

Proteins

- Composed of amino acids
- Highly complex three-dimensional structures
- Peptides are smaller chains of amino acids
- Nucleic acids
 - Composed of nucleotides
 - Deoxyribonucleic acid (DNA)
 - Ribonucleic acid (RNA)

2.1 Introduction

- Major subdivisions of eukaryotic cells
 - Plasma membrane (cell membrane)
 - Separates the cell's contents from the surrounding environment
 - Selectively controls movement of molecules between intracellular fluid (ICF) and extracellular fluid (ECF)
 - Nucleus
 - Contains DNA
 - Cytoplasm
 - Contains organelles and cytoskeleton dispersed within the cytosol

2.1 Introduction

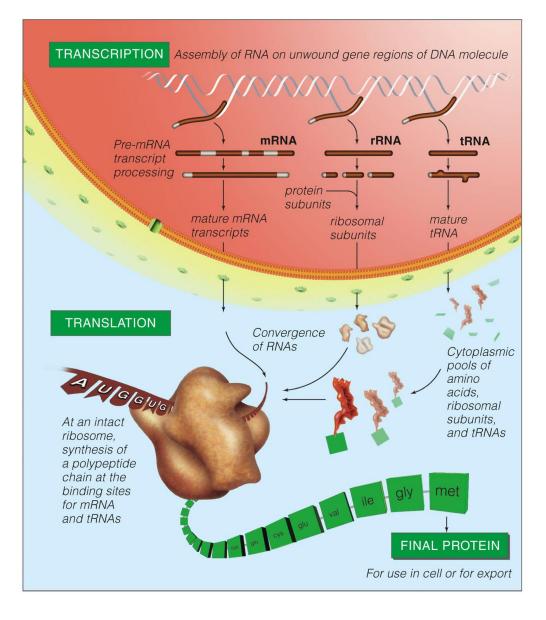

2.2 Nucleus, Chromosomes, and Genes

Nucleus

- Contains materials for genetic instructions and inheritance
- DNA is packaged with histones to form chromosomes
- Functions of DNA
 - Provides a code of information for RNA and protein synthesis
 - Serves as a genetic blueprint during cell replication
- Nucleus is the **control center** of the cell

2.2 Nucleus, Chromosomes, and Genes

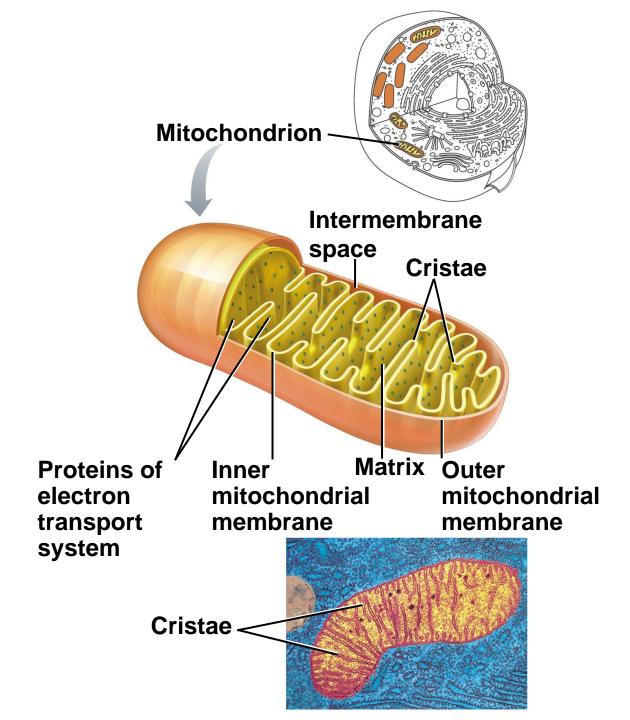

Figure 2-16 p47

2.8 Mitochondria and Energy Metabolism

- Aerobic metabolism in mitochondria relies on O₂ to convert energy in food into ATP.
 - **Aerobic** pathways require consumption of O₂
 - Anaerobic pathways can proceed in the absence of O₂
 - Energy is released when electrons are transferred from high-energy bonds to electron acceptors in oxidation-reduction reactions

2.8 Mitochondria and Energy Metabolism

- Universal energy carriers
 - Adenosine triphosphate (ATP) carries a high-energy bond in the terminal phosphate
 - When the terminal phosphate bond is split, energy is released

ATP
$$\xrightarrow{\text{splitting}}$$
 ADP + P_i + energy

- Nicotinamide adenine dinucleotide (NADH) carries energy-rich electrons that can be used to reduce other organic molecule
 - Each NADH is worth almost 3 ATPs
 - Electrons of NADH are transferred to O₂, the final electron acceptor

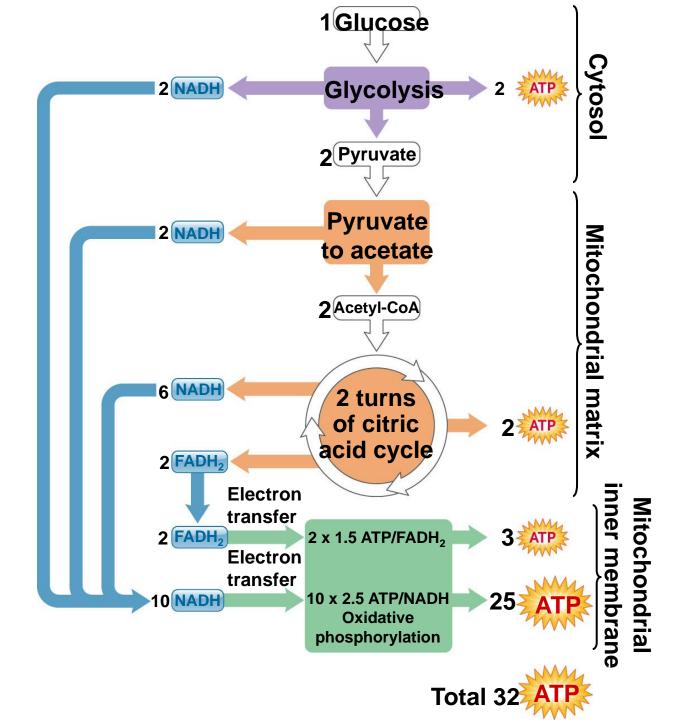

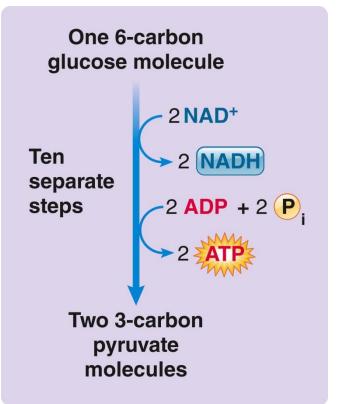

Figure 2-17 p49

Glycolysis

- Chemical process that breaks down glucose into two pyruvate molecules
- Involves 10 sequential reactions, each catalyzed by a separate enzyme

Glycolysis

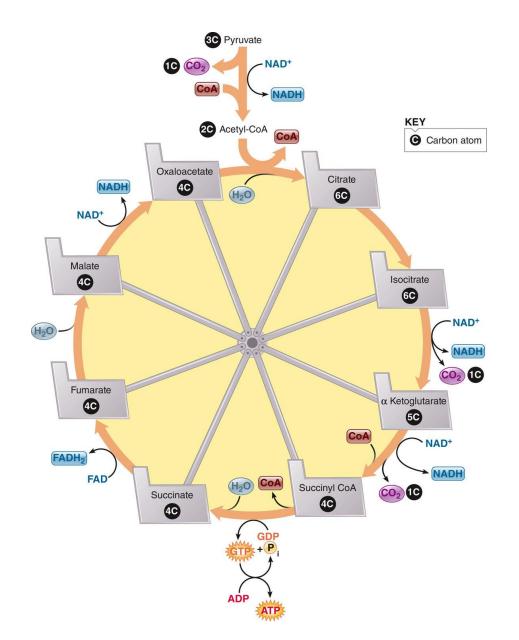

- All glycolytic enzymes are found in the cytoplasm
- Glycolysis can proceed in the absence of oxygen (anaerobic conditions)
- Releases two electrons that are transferred to NAD⁺ to form NADH
- Not very efficient -- one molecule of glucose yields only two molecules of ATP

Citric acid cycle

- Cyclical series of 8 reactions catalyzed by enzymes in the mitochondrial matrix
- Pyruvate produced by glycolysis enters the mitochondrial matrix
- Pyruvate is converted to acetyl CoA by removal of a carbon and formation of CO₂

Citric acid cycle

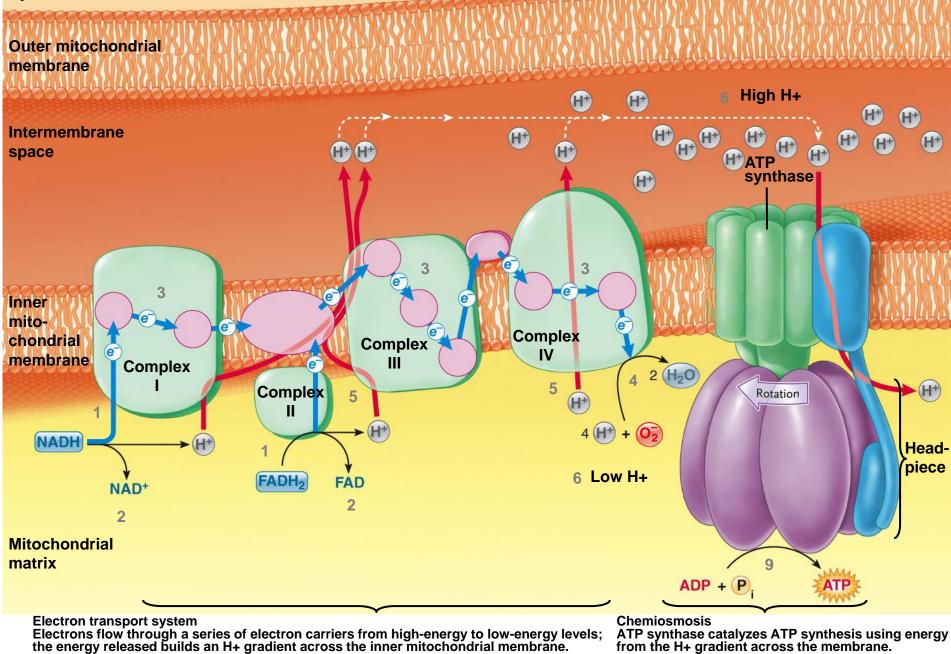

- Acetyl CoA enters the citric acid cycle by combining with oxaloacetic acid to form citric acid
- Two carbons are released as CO₂
- One ATP is produced for each turn of the cycle
- The key purpose of the cycle is to produce hydrogens for entry into the electron transport chain

Electron transport chain

- Electron carrier molecules are located in the inner mitochondrial membrane
- Electrons are transferred through a chain of reactions with the electrons falling to lower energy levels at each step
- O₂ is the final electron acceptor of the electron transport chain (also called respiratory chain)
 - O₂ combines with electrons and hydrogen to form H₂O

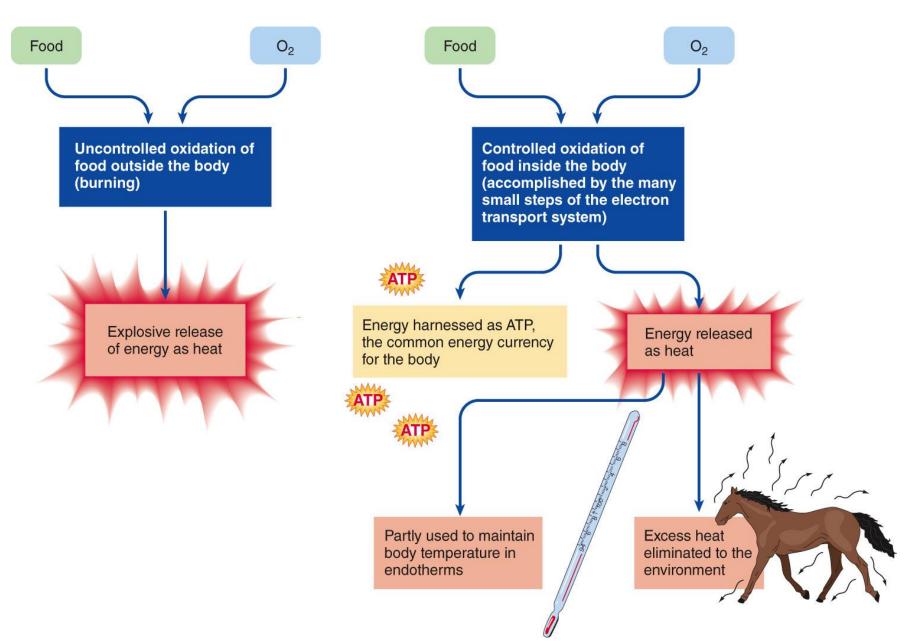

Oxidative phosphorylation

Electron transport chain

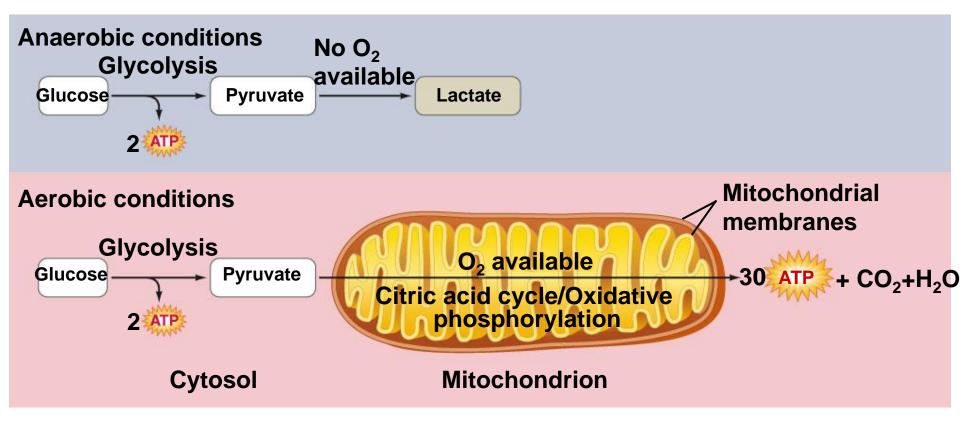

- Some of energy released during transfer of electrons is used to synthesize ATP (oxidative phosphorylation)
- Total ATP yield is 30 ATPs per molecule of glucose

Food + $O_2 \longrightarrow CO_2 + H_2O + ATP$

(necessary for oxidative phosphorylation) (produced primarily by the citric acid cycle) (produced primarily by the electron transport chain)

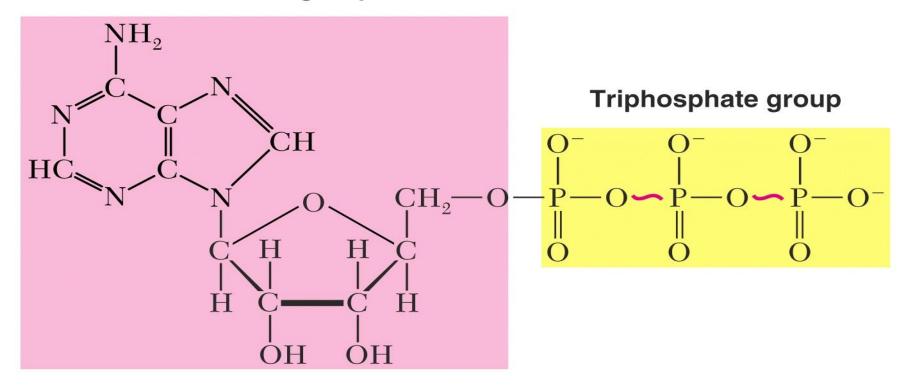

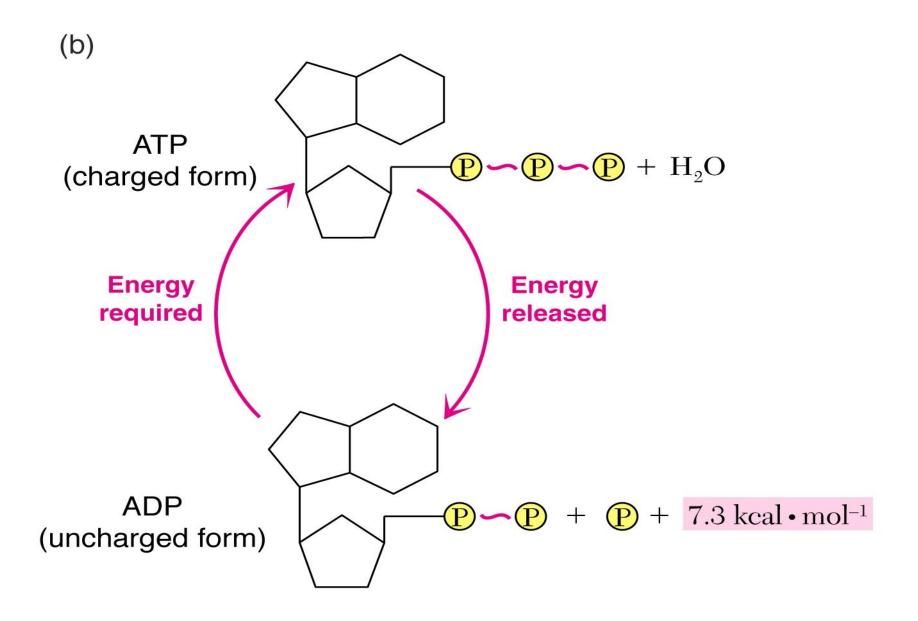

- Metabolism under anaerobic conditions
 - O₂ deficiency forces cells to rely on glycolysis
 - Pyruvate is converted to lactate
 - Lactate accumulates in the tissues and reduces pH
 - Lactate can be converted back to pyruvate

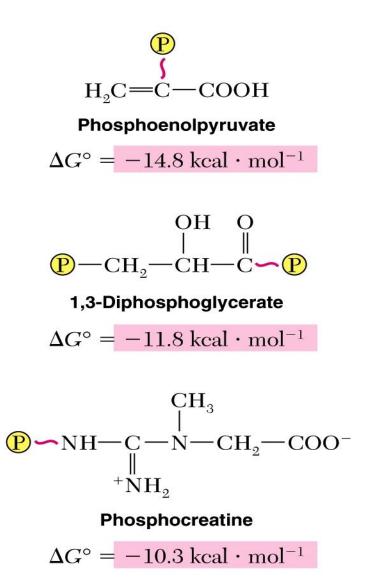

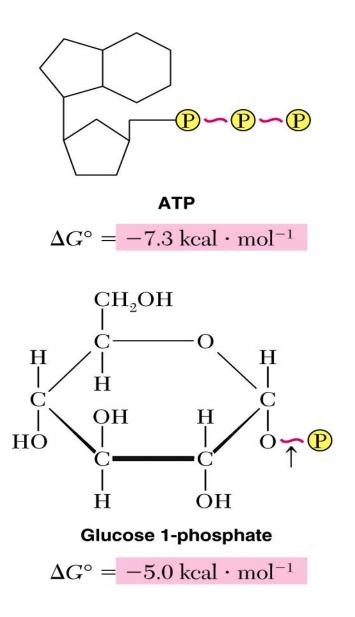

(a)

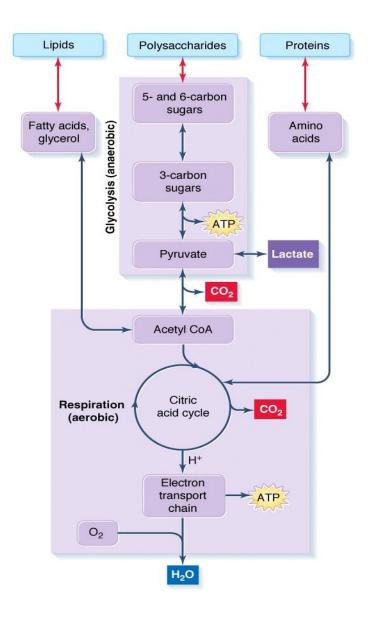

Adenosine group

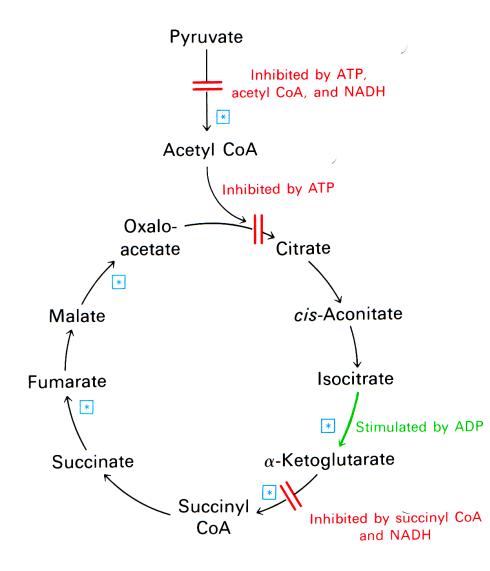

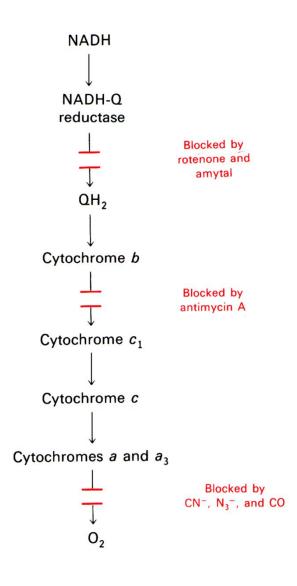

36 ATP (?)

Total 38 ATP (?)

ł

Endosymbiotic theory - Lynn Margulis. Why is it important to know this? Endosymbiotic theory Lynn Margulis

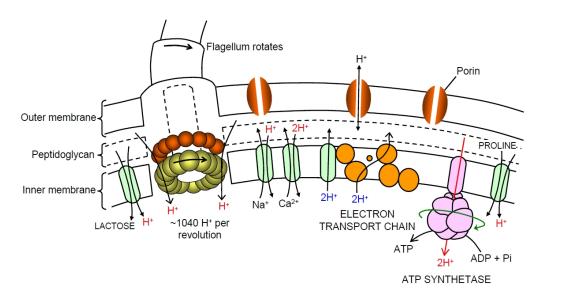

Look it up: https://en.wikipedia.org/wiki/Symbiogenesis

Among the many lines of evidence supporting symbiogenesis are that new mitochondria and plastids are formed only through binary fission, and that cells cannot create new ones otherwise; that the transport proteins called porins are found in the outer membranes of mitochondria, chloroplasts and bacterial cell membranes; that cardiolipin is found only in the inner mitochondrial membrane and bacterial cell membranes; and that some mitochondria and plastids contain single circular DNA molecules similar to the chromosomes of bacteria.

Why is it important?

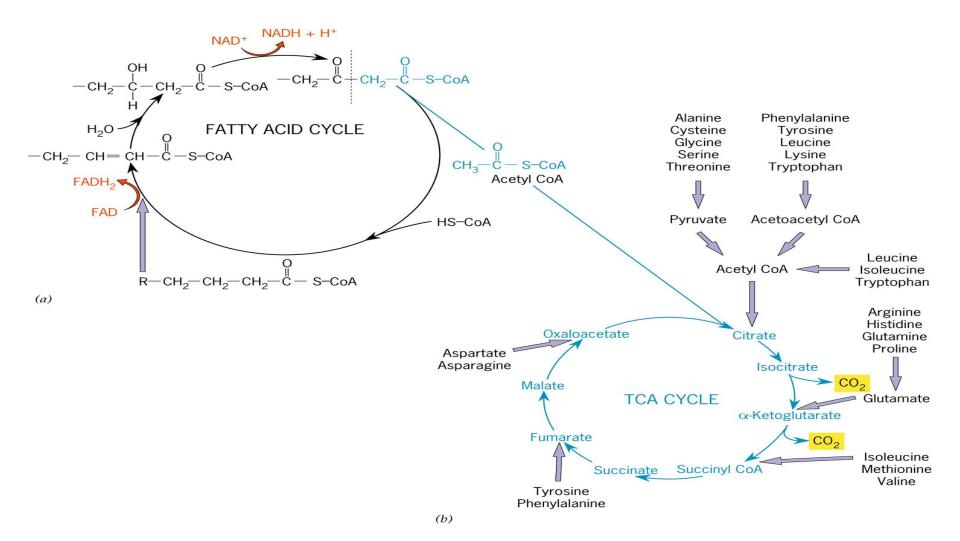

Any medical / health application

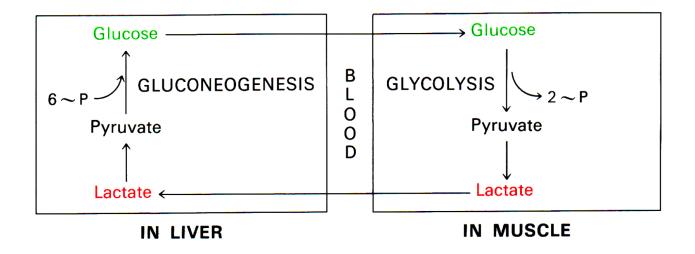

The proton gradient across bacterial membranes

Protons are pumped out across the membrane by the electron transport system (ETS or electron transport chain, ETC) similar to the case in mitochondria (using NADH as energy source, derived from glycolysis and Kreb's cycle) create a proton gradient used in ion and metabolite transport as well as ATP synthesis and flagella rotation. (Based on Boyd 1988)

hint

Glycogen-storage of glucose

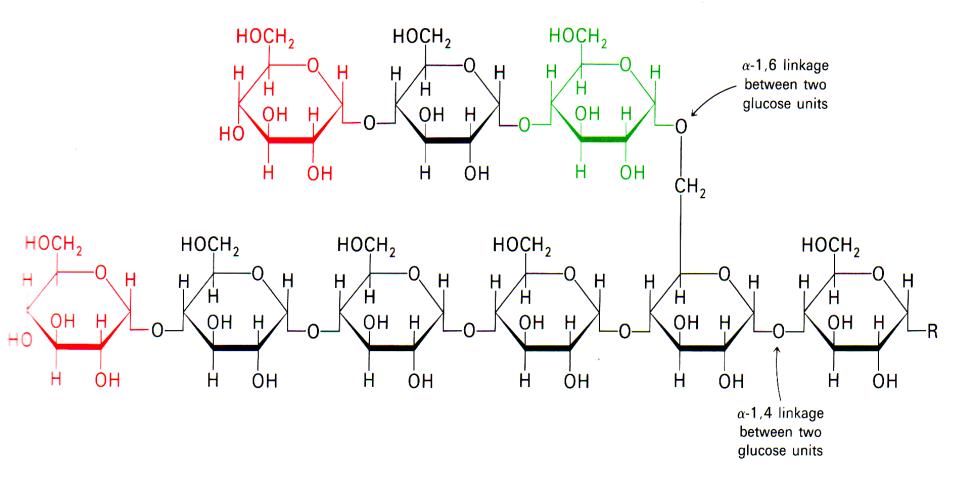

Table 16-1Glycogen storage diseases

٤.

Туре	Defective enzyme	Organ affected	Glycogen in the affected organ	Clinical features
l VON GIERKE'S DISEASE	Glucose 6-phosphatase	Liver and kidney	Increased amount; normal structure.	Massive enlargement of the liver. Failure to thrive. Severe hypoglycemia, ke- tosis, hyperuricemia, hy- perlipemia.
II POMPE'S DISEASE	lpha-1,4-Glucosidase (lysosomal)	All organs	Massive increase in amount; normal structure.	Cardiorespiratory failure causes death, usually be- fore age 2.
III CORI'S DISEASE	Amylo-1,6-glucosidase (debranching enzyme)	Muscle and liver	Increased amount; short outer branches.	Like Type I, but milder course.
IV ANDERSEN'S DISEASE	Branching enzyme $(\alpha-1, 4 \longrightarrow \alpha-1, 6)$	Liver and spleen	Normal amount; very long outer branches.	Progressive cirrhosis of the liver. Liver failure causes death usually be- fore age 2.
V McARDLE'S DISEASE	Phosphorylase	Muscle	Moderately increased amount; normal structure.	Limited ability to perform strenuous exercise because of painful muscle cramps. Otherwise patient is nor- mal and well developed.
VI HERS' DISEASE	Phosphorylase	Liver	Increased amount.	Like Type I, but milder course.
VII	Phosphofructokinase	Muscle	Increased amount; normal structure.	Like Type V.
VIII	Phosphorylase kinase	Liver	Increased amount; normal structure.	Mild liver enlargement. Mild hypoglycemia.

Note: Types I through VII are inherited as autosomal recessives. Type VIII is sex-linked.

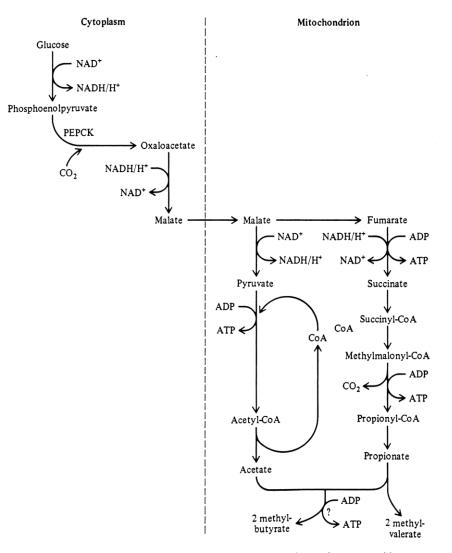

FIGURE 3-18 Linkage of glycolysis with citric acid cycle pathways is an anaerobic metabolic pathway that provides additional ATP formation. These pathways are found, for example, in many platyhelminth worms.

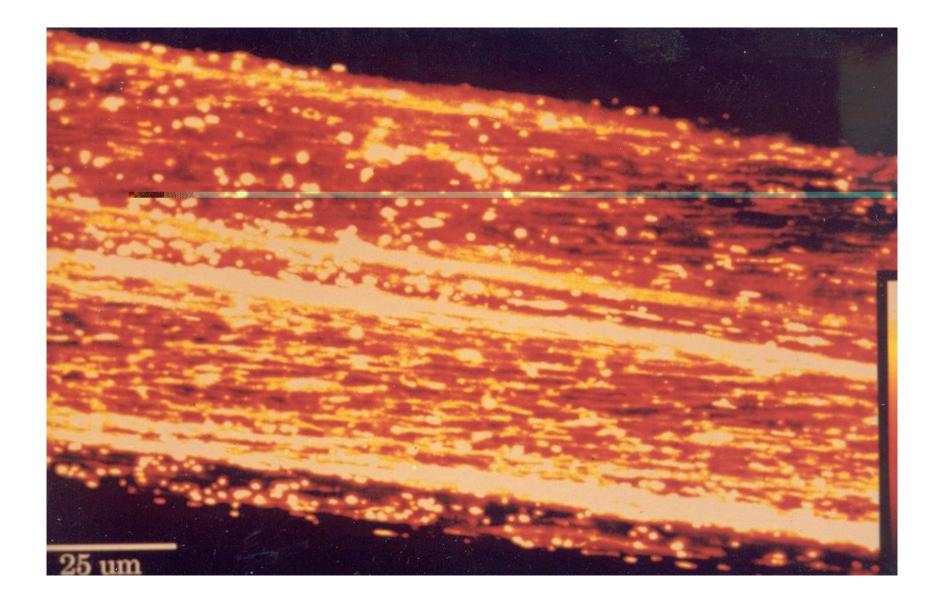

- Tolerance of O₂ deficiency varies widely among organisms
 - Obligate aerobes -- require O₂ continuously for survival (e.g. mammals)
 - Facultative anaerobes -- can adapt to anaerobic conditions for days or months (e.g. brine shrimp embryos)
 - Obligate anaerobes -- thrive in anaerobic environments
 - Inhibited or killed in the presence of O₂
 - Archaea, bacteria (e.g. *Clostridium*), and protozoa (e.g. *Entamoeba*)

Anaerobic-Bacteria, some yeasts, some invertebrates can live in low O_2 .

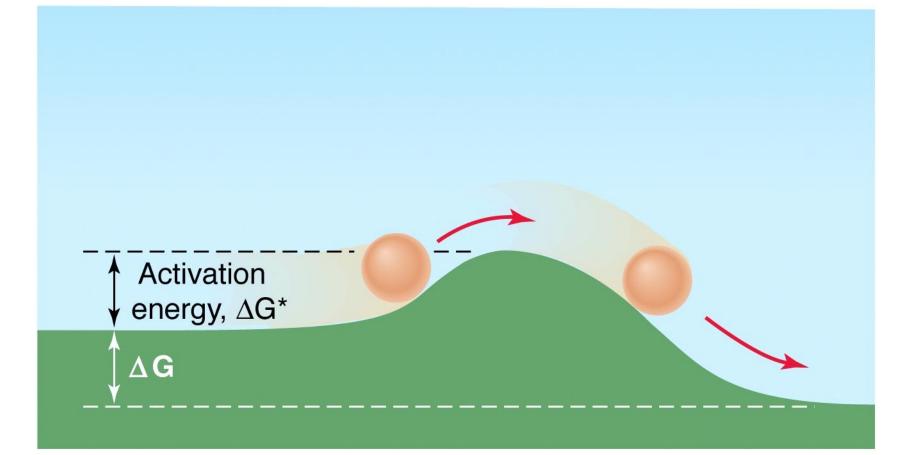

Ex. Clostridium botulinum can not grow in O_2 .

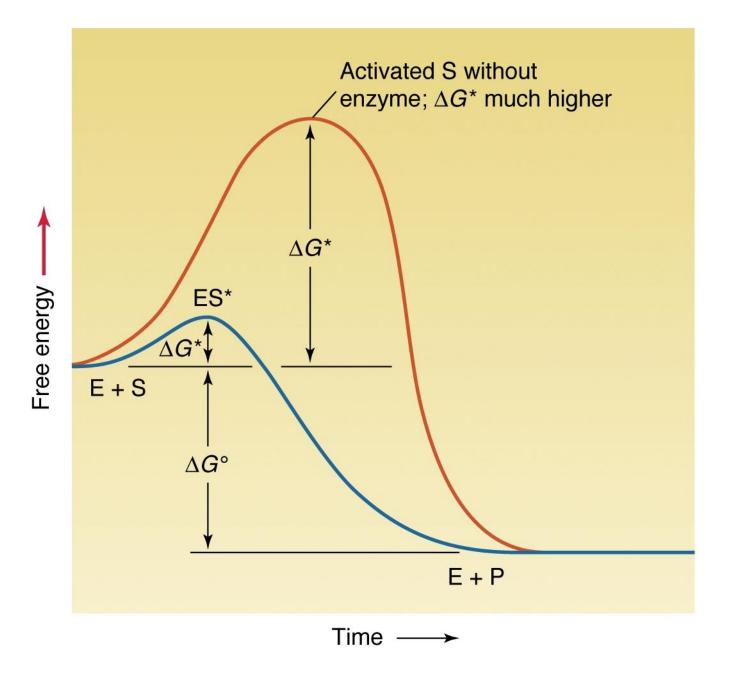

Aerobic- require a supply of O_2 . Some tissues like muscle can function anaerobically and build up an " O_2 debt" but pay back occurs.

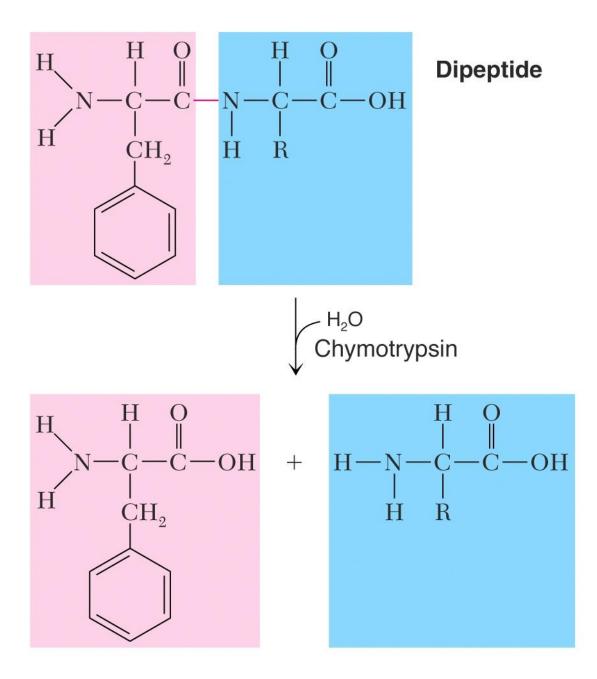

With O_2 the cells are 20 times more efficient to produce ATP.

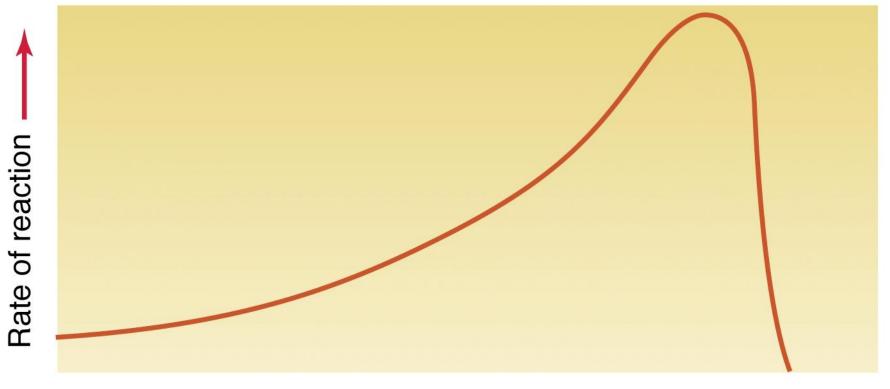

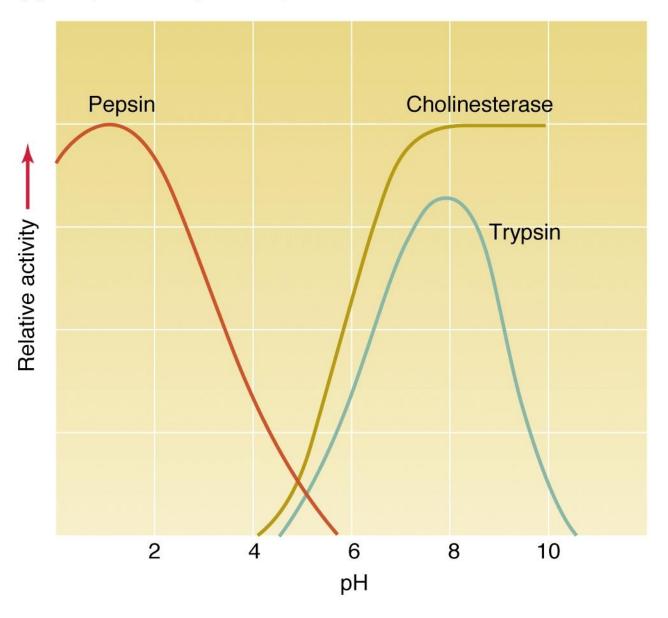

(a) Enzyme activity versus temperature

(b) Enzyme activity versus pH

Metal ion	Some enzymes requiring this cofactor		
Ca^{2+}	Phosphodiesterase		
	Protein kinase C		
$\mathrm{Cu}^{2+}\left(\mathrm{Cu}^{+}\right)$	Cytochrome oxidase		
	Tyrosinase		
Fe^{2+} or Fe^{3+}	Catalase		
	Cytochromes		
	Ferredoxin		
	Peroxidase		
K ⁺	Pyruvate phosphokinase (also requires		
	$Mg^{2+})$		
Mg^{2+}	Phosphohydrolases		
	Phosphotransferases		
Mn^{2+}	Arginase		
	Phosphotransferases		
Na ⁺	Plasma membrane ATPase (also requires		
	K^+ and Mg^{2+})		
Zn^{2+}	Alcohol dehydrogenase		
	Carbonic anhydrase		
	Carboxypeptidase		

Table 3-6 Metal ions functioning as cofactors

Source: Adapted from Nelson and Cox, 2000.

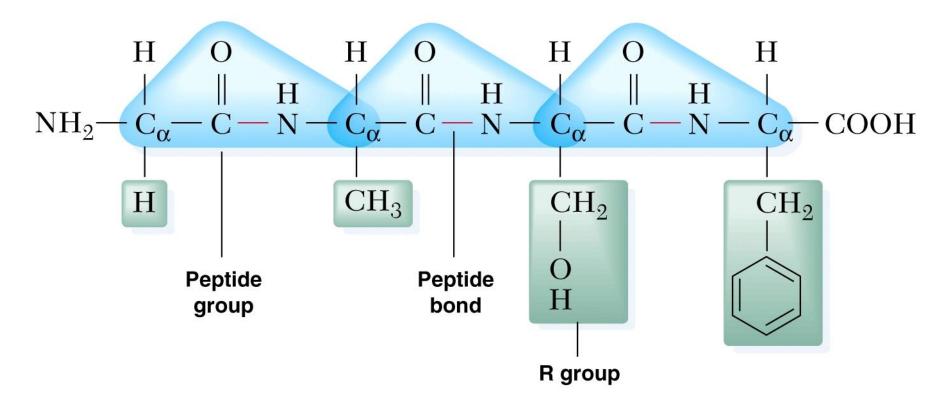

Proteins

- A lot in cells. ¹/₂ of the dry mass.
- Various structures.

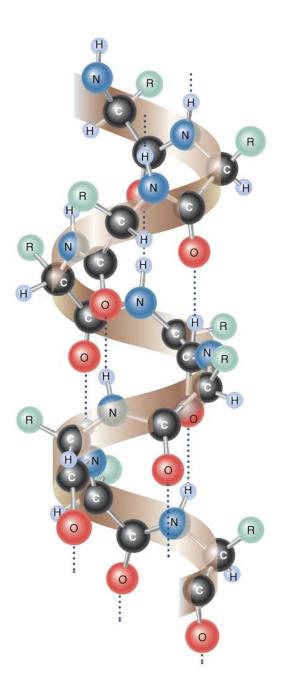

-Primary, secondary, tertiary, and quaternary

(a) General structure of alpha-amino acids COOH $NH_2 - C_{\alpha} - H$ R

(b) Structure of a tetrapeptide

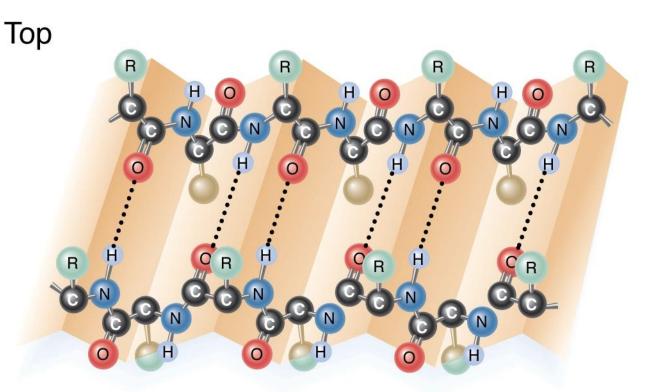

Secondary Alpha helix

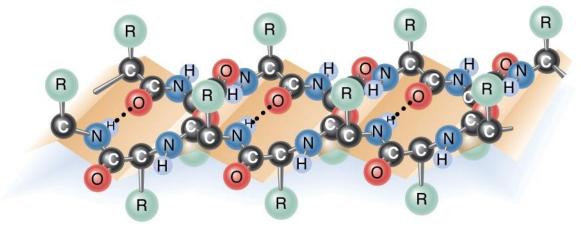

Secondary

Beta-sheet

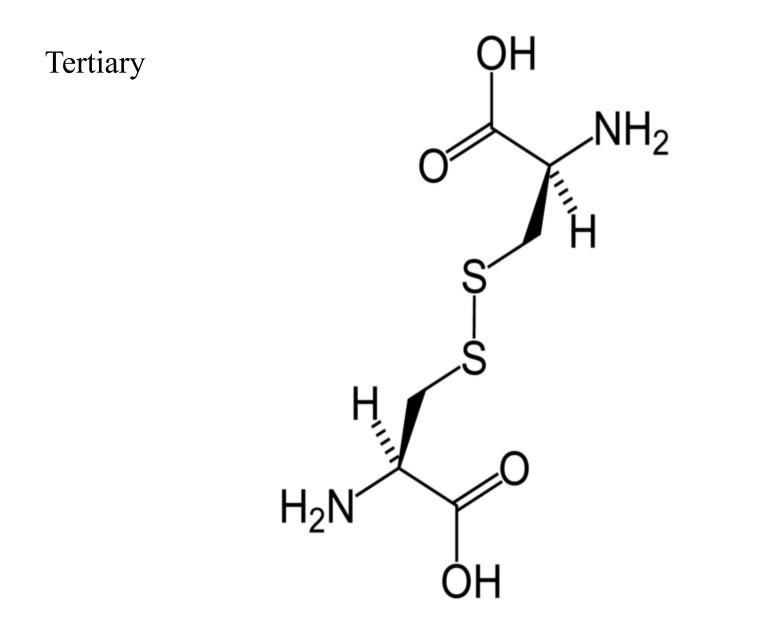

Side

Secondary types

- alpha helix: alpha-Keratins for hair and wool
- Beta sheets: (Harder) beta- Keratins for reptile scales and turtle shells

Quaternary- a couple of subunits coming together like Heme units.

ie., Hemoglobin
